RE: Notice of Change for M83513 and Micro-D Connector Products

To whom it may concern:

We write to notify you that there will be a change in the contact design of our M83513 and Micro-D Connector Products.

Nature of the Change

The design change is to convert socket contacts to a two-piece press fit design as an alternative to solid wire crimping. This change will not affect the functional design or performance requirements of the final part and has been fully tested per QTR9300886 Retention and QTR9300887 Alternate Processing of Contacts, approved by DLA on March 31, 2026 as part of our 2026 Retention Qualification.

Justification for the Change

This change was driven by our commitment to improving quality and performance of our product while maintaining supply chain efficiency. Adding this process improvement will enable us to achieve greater manufacturing consistency, reduce lead times associated with third party suppliers and improve overall production capacity.

Impact of Change

The change described herein is internal and not apparent from external examination. Functionality and reliability will be identical to current designs.

If you have any questions, please call or email us at the number and email address below and our customer care agents will be happy to answer your questions.

Please confirm your acknowledgement of this change on receipt of this letter.
